On the other hand, if you're completely off the grid, you're already on your own power island. Your islanding solar inverter works independently from the power grid. If there's a storm or other event that knocks ...

You must use an off-grid inverter capable of AC coupling and controlling the microinverters. GT inverters don't regulate themselves. They assume an infinite grid in which to dump whatever they can deliver. The grid source inverter must be capable of "frequency shifting" to instruct the GT inverters to reduce/stop output.

In off-grid operation, the Sunny Island inverters must be able to limit their output power, if PV inverters are connected on the AC side. This situation can occur when, for example, the battery of the Sunny Island is fully charged and the PV power available from the PV system exceeds the power requirement of the connected loads.
