

Can concrete be used as energy storage?

By tweaking the way cement is made, concrete could double as energy storage--turning roads into EV chargers and storing home energy in foundations. Your future house could have a foundation that's able to store energy from the solar panels on your roof--without the need for separate batteries.

Could carbon black cement store 10 kilowatt-hours of energy?

If carbon black cement was used to make a 45-cubic-meter volume of concrete--roughly the amount used in the foundation of a standard home-- it could store 10 kilowatt-hours of energy, enough to power an average household for a day, the team reports today in the Proceedings of the National Academy of Sciences.

Could electrified cement make energy storage more affordable?

By offering a cheaper alternative to more expensive batteries, electrified cement could also make storing renewable power more affordable for developing countries, says Admir Masic, a chemist at MIT and a co-author of a study. "This puts us into a new space for energy storage at prices accessible anywhere in the world."

Could a low-cost energy concrete storage system make sustainable power available 24/7?

A new, low-cost energy concrete storage system could make sustainable power available 24/7, no batteries needed. Solar and wind power are excellent renewable sources, but they have one big problem: They're not always available. The wind doesn't always blow; the sun doesn't always shine.

Could a new 'supercapacitor' concrete foundation Save Energy?

Since the new "supercapacitor" concrete would retain its strength, a house with a foundation made of this material could store a day's worth of energy produced by solar panels or windmills, and allow it to be used whenever it's needed.

What is the MIT Concrete Sustainability Hub?

The work was supported by the MIT Concrete Sustainability Hub, with sponsorship by the Concrete Advancement Foundation. MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy.

This new way of creating a supercapacitor - an alternative to batteries that can discharge energy much faster - could be incorporated into the foundations of both buildings and wind turbines.

Scaled up further, electrified roadways could power electric cars as they drive. And if scientists can find a way to do this all cheaply the advance might offer a nearly limitless capacity for storing energy from intermittent renewable sources, such as solar and wind.

MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement, water, and carbon black, the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.

In a paper published this June, they detailed how they combined cement, water and a form of charcoal called carbon black -- the same stuff used to write the Dead Sea Scrolls -- to create a concrete that acts as a ...

In a paper published this June, they detailed how they combined cement, water and a form of charcoal called carbon black -- the same stuff used to write the Dead Sea Scrolls -- to create a concrete that acts as a supercapacitor, an alternative to a battery for storing energy.

Projects such as low-emissions cement and energy-storing concrete raise the prospect of a future where our offices, roads and homes play a significant part in a world powered by clean energy.

Made of just cement, water, and carbon black (which resembles powdered charcoal), the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar...

MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement, water, and carbon black, the device could form the basis for inexpensive systems that store intermittently ...

Cement and water, with a small amount of carbon black mixed in, self-assembles into fractal branches of conductive electrodes, turning concrete into an energy-storing supercapacitor

Electron-conducting concrete combines scalability and durability with energy storage and delivery capabilities, becoming a potential enabler of the renewable energy transition. In a new research brief by the CSHub and MIT ec&#179; hub, we explore the mechanics and applications of this technology.
