

Will Guernsey Electricity replace a 'faulty' substation this winter?

Guernsey Electricity will replace a 'faulty' substation to 'meet increasing needs' this winter. The new equipment for the Rue du Felconte and Rue des Adams area 'will improve resilience and increase capacity in the local network', it said. The substation will be replaced and the work will be completed in phases from Tuesday until November.

How is Guernsey connected to the European electricity grid?

Guernsey is connected to the European Electricity Grid through a submarine cable link (via Jersey) into the Cotentin peninsula, due east of Jersey.

What is Guernsey's Electricity strategy?

In September 2023 The States of Guernsey agreed the Electricity Strategy. This detailed document covers the period up to 2050 and sets out a high-level strategic plan of how Guernsey could meet the anticipated increase in demand for electricity.

When did Guernsey start using electricity?

In 1898 Edmundsons Electricity Corporation was granted the concession to build and operate an electricity supply in Guernsey. 7 kilometres (4.3 mi) of cables would have to be installed below ground within two years. In February 1900 150 kW could be generated from the power station at Les Amballes, St Peter Port. : 6-7

Why is Guernsey laying a new 33kV cable?

Guernsey Electricity are laying a new 33kV cable 6.5 km across the Island, connecting two substations from the North of the Island to the critical infrastructure of the Princess Elizabeth hospital. Supporting the upgrade of electrical infrastructure for the PEH and the network supplying the South of Guernsey.

Will Guernsey Electricity install a community-scale solar array?

Guernsey Electricity are delighted to have worked with The Little Green Energy Company to install another vast community-scale solar array, this time on the roof of the newly reopened GROW Ltd headquarters.

components and flow of power through the substation along with a backup power supply to ensure the equipment continues to function after a loss of electricity. Three types of BPS substations exist: transmission, switching, and distribution.¹³ Transmission substations connect power plants to the BPS grid and convert low-voltage electricity to HV.

Transmission substations are where circuits connect, creating a network for energy to flow at high voltages. Distribution substations are responsible for electricity distribution to the customers within electricity grids. These substations operate at a lower voltage compared to transmission substations, typically ranging from 12 kV to 34.5 kV.

The network is operated and managed by The Channel Islands Electricity Grid (CIEG), a joint company set up in 1998 between Guernsey Electricity and Jersey Electricity. In 2000, the CIEG funded their first cable, the 100 Mega watt (MW) "Normandie 2" from France to Jersey and the 60 MW cable from Jersey to Guernsey, known as "GJ1".

The Role of Substations in the Power Grid. Substations play a crucial role in the smooth functioning of the power grid. They serve as nodes that facilitate the transmission and distribution of electricity. For instance, imagine ...

The Substation or Switchyard can be conventional air insulated substation (AIS) or Gas Insulated Substation (GIS) or a Hybrid Substation. The factors to be taken into account for designing substations shall be as under:
a. The choice of site for a substation or switchyard shall be based on technical, economic and environmental factors.

The existing substations in North Wales do not have sufficient connection capacity for additional connections, and therefore a new substation is required along the existing 400 kilovolt (kV) overhead line that runs between existing National Grid substations at Deeside and Trawsfynydd. What we are proposing

For a stable and reliable grid, substations can use phase-shifting transformers (PSTs) to manage the electric power transmission by controlling the phase angle of power flow. PSTs can also regulate the voltage in the substation, further improving the voltage profile. PSTs are often used to connect asynchronous grid systems and HVDC transmission ...

Guernsey Electricity is pursuing a direct connection to France outside of the CIEG network. The proposed cable (GeM) is likely to be specified as 100MW and will require a new substation in Guernsey, and connections into the electricity grids ...

Substations located in the middle of a load area are called distribution substations. These substations may be as close together as 2 miles in densely populated areas. The substations contain power transformers that reduce the voltage from sub-transmission levels to distribution levels, usually in the range of 4.16Y/2.4 kV to 34.5Y/19.92 kV.

National Grid Electricity Transmission is consulting on proposals to build a new substation in the local area, approximately 1.4km from Navenby, Lincolnshire. There is a shift towards renewable energy sources, meaning there is greater demand on our network to connect new sources of electricity and customers.

This range in size and capacity allows substations to cater to a wide array of electrical power distribution needs. GET IN TOUCH The ultimate solution for reliable power control! call us at 276-285-3841
Types of Substations: Substations can be categorized into several types based on their functions and roles within the power grid.

Guernsey Electricity has committed to replacing a key substation in St Peter's over the next two months before the seasonal increase in electricity demand this Winter. ... Burns & McDonnell wins National Grid substation contract. Aug 2, 2022. National Grid has awarded engineering-led construction firm Burns & McDonnell an engineer-procure ...

This kind of substations transform the high voltages used for efficient long distance transmission through the grid to the sub-transmission voltage levels This way of power transmission through supply lines to the distribution substations in the surrounding regions is far more cost-effective.

This ingenious network of specialist equipment is made up of 7,000km of overhead line, 300 substations and 22,000 pylons, which comprise the physical infrastructure of the electricity system. ... Overhead lines are the electrical ...

A virtual substation allows grid operators to control the medium-voltage (MV) side and monitor, measure, optimize, and control the low-voltage (LV) side, where consumer technologies like renewables and electric vehicle (EV) charging come into play. Flexible, incremental automation and optimization can then be deployed on a generic hardware ...

Guernsey Electricity will replace a "faulty" substation to "meet increasing needs" this winter. The new equipment for the Rue du Felconte and Rue des Adams area "will improve resilience and ...
