What is a main bearing for a wind turbine?

the Creative Commons Attribution 4.0 License. This paper presents a review of existing theory and practice relating to main bearings for wind turbines. The main bearing performs the critical role of supporting the turbine rotor, with replacements typically requiring its complete removal.

Can analytical models be used to model wind turbine main bearings?

Abstract. This paper considers the modelling of wind turbine main bearings using analytical models. The validity of simplified analytical representations used in existing work is explored by comparing main-bearing force reactions with those obtained from higher-fidelity 3D finite-element models.

Do wind turbine bearings need to be replaced?

This paper presents a review of existing theory and practice relating to main bearings for wind turbines. The main bearing performs the critical role of supporting the turbine rotor, with replacements typically requiring its complete removal.

What is the main bearing theory of a wind turbine?

(Hart et al., 2020) documented available wind turbine main bearing theory, design and practices which are completely different from other existing bearing set ups in the wind turbine. Load generated by rotor on bearings and tribological aspects of these bearings are presented along with bearing modelling and fault diagnosis techniques. ...

Can a turbine rotor be supported by a main bearing?

For example, in addition to supporting the turbine rotor, some direct-drive configurations require the main bearing to also support the generator rotor while maintaining an appropriate generator air gap. Coupled approaches to the modeling and assessment of wind turbine drivetrain systems will therefore become increasingly important.

What are the operating conditions and loading of wind turbine main bearings?

The operational conditions and loading for wind turbine main bearings deviate significantly from those of more conventional power plants and other bearings present in the wind turbine power train, i.e. those in the gearbox and generator.
