What is the SEPA briefing for Microgrid controller standards?

SEPA hosted a briefing for Microgrid Controller Standards IEEE 2030.7© and IEEE 2030.8©to provide an overview of the standards and explore the challenges and next steps for microgrid standards. The briefing focused on the adoption and testing associated with IEEE 2030.7© or IEEE 2030.8© by providing: Takeaways Include:

What are Microgrid controller standards?

Microgrids have the potential to provide customers with clean, low-cost, and most critically, resilient power. SEPA hosted a briefing for Microgrid Controller Standards IEEE 2030.7© and IEEE 2030.8© to provide an overview of the standards and explore the challenges and next steps for microgrid standards.

What should a microgrid include?

Although there is general agreement on what a microgrid should include, there has been very little standardization on how to describe the functional requirements of a microgrid or on how the microgrid should operate in prac-tice. This is where the IEEE 2030.7 standard comes in.

Why do we need a standard for microgrid energy management system (MEMS)?

These cases shall be tested according to IEEE P2030.8.1 Purpose: The reason for establishing a standard for the microgrid energy management system (MEMS) is to enable interoperability of the different controllers and components needed to operate the MEMS through cohesive and platform-independent interfaces.

What are some takeaways in microgrid development?

Takeaways Include: IEEE 2030.7© and IEEE 2030.8© are an important foundation for microgrid standardization. Rapid microgrid development requires further progress in standards. Creating an adequate control standard is not possible until inverters are standardized.

Why do we need a standard for testing microgrid controllers?

Purpose: The reason for establishing a standard for testing microgrid controllers, in the context of enabling interoperability of the different controllers and components needed to operate the controller through cohesive and platform-independent interfaces, is to establish standardized testing procedures.

This standard provides technical specifications and requirements for microgrid controllers. Additionally, there are informative annexes covering the description of the microgrid, the establishment of the functional specification, the structure of the microgrid control functions, and a bibliography.

A set of testing procedures that enable verification, quantification of performance, and comparison of the performance with expected minimum requirements of the different functions of the microgrid controller are developed in this standard.

IEEE Standards documents (standards, recommended practices, and guides), both full-use and trial-use, are developed within IEEE Societies and the Standards Coordinating Committees of ...

Any time a microgrid is implemented in an electrical distribution system, it must be well planned to avoid problems. This paper discusses current microgrid technologies and standards that are being developed to address implementation of microgrids.

IEEE Standard for the Specification of Microgrid Controllers A key element of microgrid operation is the microgrid energy management system (MEMS). It includes the control functions that define the microgrid as a system that can manage itself, operate autonomously or grid connected, and seamlessly connect to and disconnect from the main ...

Better understanding of microgrids and their operation will also help co-ops develop the financial structures needed to support the different operational modes of a microgrid. This article uses the structure suggested in the IEEE 2030.7 standard as a basis for developing the functional specification for a microgrid.
