How to make the best use of a solar photovoltaic (PV) system?

How to make the best use of a solar photovoltaic (PV) system has received much attention in recent years. Integrating geographic information systems (GIS), this paper proposes a new spatial optimization problem, the maximal PV panel coverage problem (MPPCP), for solar PV panel layout design. Suitable installation areas are first delineated in GIS.

How to design a solar panel?

The spatial layout design of PV panels starts with identification of rooftop areas suitable for the panel installation in a GIS. Based on the identified suitable areas, the appropriate candidate panel sites are identified. Two important assumptions are made in this study for simplifying the illustration.

What is the optimal tilt angle of photovoltaic solar panels?

The optimal tilt angle of photovoltaic solar panels is that the surface of the solar panel faces the Sun perpendicularly. However, the angle of incidence of solar radiation varies during the day and during different times of the year.

How can GIS Help A solar PV system?

GIS finds the suitable areas for solar PV panel installation. Layout design maximizes the energy production potential of a solar PV system. The new method has been applied to identify the optimal panel layout on a rooftop. Flexible panel alignments increase the maximal energy production by up to 6%.

What factors influence the optimal tilt angle of a solar PV system?

Findings indicate that geographical locations and local climate influence the optimal tilt angle and orientation of a solar PV system. Studies reported that in the northern hemisphere PV panels facing south with a tilt angle equal to the latitude achieved the maximum yearly system performance [,,].

How to identify rooftop areas suitable for solar PV system installation?

data to identify rooftop areas suitable for solar PV system installation [11 -15]. Following these studies, a GIS-based approach is developed to identify the suitable rooftop areas. LiDAR data are first used to derive Digital Surface Model (DSM) to obtain detailed urban fabric and surroundings. Next, slope analysis, high sunlight exposure.
