

What are the optimization objectives of a microgrid system?

Considering the actual operation process of the microgrid system and its impact on the environment, the optimization objectives of this study include the operation and maintenance cost of each equipment, the carbon penalty cost of the microgrid, and the cost of energy purchase. And the optimization objectives of this study are set as follows:

What is a microgrid model?

Upon determining all parameters for microgrid operation, the microgrid model is executed to yield results for the objective function, which focuses on the cost of operation for each subsystem. The most significant contributor to cost is the MGT, accounting for natural gas price cost, natural gas tax, and maintenance costs.

What is a low-carbon economic operation optimization model of a microgrid?

Firstly, this study constructs a microgrid system structure including P2G equipment and a hybrid energy storage system of electricity and hydrogen. Secondly, aiming at minimizing the system operation cost and carbon emission penalty cost, a low-carbon economic operation optimization model of the proposed microgrid is established.

Is it possible to optimize microgrids at the same time?

At present, the research on microgrid optimization mainly simplifies multiple objectives such as operation cost reduction, energy management and environmental protection into a single objective for optimization, but there are often conflicts between multiple objectives, thus making it difficult to achieve the optimization at the same time.

How does a microgrid save money?

The savings are contingent upon the microgrid's operational mode, serving to offset costs, particularly in island mode. The incentive is determined by calculating the saved natural gas costs equivalent to the heating value of the preserved hydrogen.

What are the implications of microgrid management?

Implications for Microgrid Management: The study underscores the need for integrated strategies that balance economic incentives with sustainability goals. The findings suggest that adjustments to optimization criteria or regulatory measures may be necessary to align private microgrid operations with broader environmental objectives.
