A busbar introduce a lot of strain on the battery terminals when they are vibrating. This can cause two problems. First, the terminal breaks, and you end up with acid all over the place. The second can be loosened screws which might result in increased contact resistance and a fire. Edit, i might have misunderstood your goal with the busbar.

After the research, the idea appeals to me as a way to avoid the potential problems that might come along with many crimped cable ends, and result in a neater looking battery bank. Here is what my research reveals: The current carrying capacity of copper busbar is commonly figured as 1.25 amps per square mm of cross sectional area, which means ...

In the case of 2S2P batteries attached to bus bars, whichever battery is the least charged will draw the most. Once established as a properly assembled 2S2P pack, they will all draw and discharge at the same rate (except for minor differences). Effectively making it behave like one big battery.

Hi am I able to add a new battery bank to my system by connecting it to the existing busbar? I want to increase my battery capacity. Already have a 48v 10kwh battery on the busbar. Also do I need to adjust the gauge?

Mount the Busbar: First, mount the busbar on a non-conductive, fire-resistant surface. The busbar should be located close to your battery bank and inverter to minimize the length of the cables and thus reduce power loss. ...

Essential for connecting battery banks in solar and wind energy storage solutions, optimizing energy storage and retrieval. Industrial Applications: Utilized in UPS systems, telecommunications, and heavy machinery where reliable power distribution is critical.

When I put my original system together, nobody was talking about using bus bars for the battery bank. Now it seems it's the only sure way to give batteries a chance to balance, so I'm going to try them.

Fortunately, this is for home solar, so no vibration concern. Current flow is the only issue I've had, and hopefully the bus bar and some cables to distribute current to multiple battery terminals will remedy it. This does add another \$35-40 to my battery bank cost with the bus bar and new cables I'll need.
