How can wind power plants improve microgrid performance?

Wind power plants can be integrated with demand side management strategies to improve microgrid system's performance and reduce cost of generation. Small-scale low power wind turbines are being installed in high rise buildings to generate electric power in locations with very good wind contour profiles.

How DFIG control a wind turbine?

DFIGs provide only primary control for frequency, but majority of control is provided by the conventional power plants. Using power electronic converters, kinetic energy stored inside the variable speed wind turbine (VSWT) is used for inertial control, pitch control and speed control.

How is a wind turbine connected to a grid using MatLab/Simulink?

WECS was connected to the grid using an inverter (grid-tied). MATLAB/Simulink was used for demonstrating the developed MPPT algorithm and was validated for system performance with conventional perturb and observe MPPT algorithm. In a standalone WECS, wind turbine is connected to the generator feeding an isolated load.

How is PMSG connected to the utility grid?

PMSG was connected to the utility grid with the help of a back-to-back voltage source converter (VSC). Similar shape was maintained with changes in wind velocity while changing in location. Speed control concept was illustrated using a PMSG dynamic model. For eliminating reluctance torque, the d-axis current was forced to zero.

What is a grid tied permanent magnet synchronous generator (PMSG)?

Typical layout of a grid tied permanent magnet synchronous generator (PMSG)-based WECS is shown in Fig. 2. Firstly, the kinetic energy of wind is converted to mechanical energy through wind turbine, which acts as a prime mover for the PMSG system.

What is wind energy conversion system (WECs)?

Wind energy conversion system (WECS), as the name suggests, taps the on-site wind mechanics to convert wind energy into mechanical power of rotation. Mechanical power of wind turbines is then converted into electrical energy through generators. Present chapter deals with technological aspects of design and operation for grid-integrated WECSs.
