

How do Solar balloons work?

Solar balloons, in which solar radiation is used to heat directly the air in a hot-air flying balloon, can be used as a mixed power system that exploits both solar radiation and high-altitude winds.

Can a solar balloon generator use wind to generate energy?

The solar balloon generator remains primarily a solar system, that can exploit wind as an integration to the energy production. Many thanks to Paola Boito (University of Limoges) for reading and revising the manuscript before the submission. Energy conversion efficiency of the pumping kite wind generator

What is a solar balloon?

1. Introduction Solar balloons are hot air balloons heated directly by the sun; if the balloon is sufficiently large and light, solar heating is enough to generate an Archimede upward lift that makes the balloon fly.

Can helium balloons convert solar energy to electricity?

This work showed that a suitable balloon, sustained with a Helium chamber and completely deflated during its descent, can convert solar energy to electricity with an efficiency up to 5% and more; moreover, it can work in presence of winds, usefully exploiting the wind to produce additional energy.

What is the energy production phase of a balloon?

The energy production phase starts with the balloon inflated at ground level, with inner air at the same temperature as external air. This is the condition immediately following the previous descent and inflation with air taken by the surroundings. The initial uplift force is only due to the Helium in the closed chamber of the balloon.

Can hot air balloons be used to generate energy?

An application of common hot-air balloons to the production/generation of energy was introduced by Edmonds (2009), who proposed the use of a hot air balloon heated at ground level by an external solar collector. The device is very simple: an alternator/dynamo is connected to the windlass on which the balloon rope is wound.
