

How much mass can a wind turbine tower reduce?

The wind turbine tower mass has been minimized under multiple design constraints, and the optimization model has been implemented in a representative 2.0 MW onshore wind turbine, resulting in a mass reduction of 2.9%.

How can wind turbine towers improve project performance?

The aim of the research is to present a new design for wind turbine towers at a time when attention is focused on breaking up information silos and improving project performance by transforming standard construction processes into more industrialized ones.

What is a dynamic model of a wind turbine tower?

Use the link below to share a full-text version of this article with your friends and colleagues. A dynamic model of a wind turbine tower is established to investigate its dynamic responses under wind and earthquake loads. Then a generalized global spatial discretization method is used to solve the problem.

Are wind turbine tower vibrations reduced after optimization?

Results demonstrate that the comprehensive performances of the wind turbine tower especially the tower top vibration have been greatly reduced after optimization. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Does a wind turbine tower have a dynamic response?

The data that support the findings of this study are available from the corresponding author upon reasonable request. Summary A dynamic model of a wind turbine tower is established to investigate its dynamic responses under wind and earthquake loads. Then a generalized global spatial discretization method is used ...

Why is a wind turbine tower important?

Ultimately, the role of the wind turbine tower in managing vibrations is crucial to the reliable and efficient operation of wind turbines. Through their precise design, construction, and maintenance, wind turbine towers enhance the efficiency, durability, and safety of wind energy systems.

The development of the tower, that is, the foundation that supports the structure of the wind turbine, has changed compared to the first windmills built of wood. Today, the wind turbine tower is usually made of steel ...

An optimum design of the onshore wind turbine (WT) tower structure is crucial for achieving an economic, efficient and safe design of the entire onshore WT system. In this study, an integrated structural optimisation framework for ...

This contribution presents a novel methodology to evaluate the lifetime extension potential of wind turbines--taking towers as the key component that preserves onshore turbines' structural integrity--as a consequence of the ...

Wind energy is considered one of the most important sources of renewable energy in the world, because it contributes to reducing the negative effects on the environment. The most important types of wind turbines are horizontal and ...

This paper will present the research project "hybrid tower for wind turbines" funded by the State of Hesse, Germany, which focuses on a new, efficient and economical design for high wind turbine towers. The new hybrid tower; ...

The wind turbine tower was further studied, integrating also artificial intelligence, resulting in tower mass restriction, structural reliability, ... Notably, a critical modification is the ...

N2 - If a vertical axis wind turbine is mounted offshore on a semi-submersible, the pitch motion of the platform will dominate the static pitch and dynamic motion of the platform and wind turbine ...

reduced by 2789 Kg. This work provides a scientific basis for the structural design of the tower in service. KEYWORDS Wind turbine tower; bionic bamboo tower; correlation analysis; multi ...

The wind turbine tower (WTT) elevates the rotor and the nacelle above ground level to a minimum height, which corresponds to the diameter of the rotor. This ensures that ...

FAST wind turbine software evaluates the proposed controller scheme, demonstrating effective reduction of the 1P periodic loading and the tower's natural frequency excitation in the side ...

As wind turbines become larger and their towers more slender, aeroelastic effects play a bigger role in the wind turbine's dynamic behavior. This study focuses on the along-wind aerodynamic damping of wind turbine towers, ...

If we look at the history of renewable energy, we can see that the first wind turbines were installed on UK land back in July 1987. This 3.7 MW turbine was tucked away in Orkney and was the first installation to provide ...

1 INTRODUCTION. The vast majority of modern wind turbines today adopt an upwind rotor configuration. Historically, downwind rotor configurations fell out of favor because ...
